Prices of all cards

Number of Cards vs. Card price ($)

- The graph shows the distribution of card prices.
- The y-axis represents the number of cards, and the x-axis represents the card price in dollars.
- The graph displays a power-law distribution, where a small number of cards have very high prices, and a larger number of cards have much lower prices.

This indicates that there is a significant disparity in card prices, with some cards commanding much higher prices than others.
